

West separate member access

Works for nested lists too

```
BAS::MetaEntry me{
    .meta = {
        .series = 'A'
    }
    , .defacto = {
        .caption = had->heading
        , .date = had->date
    }
};
```

West separate member initializers

```
struct AEntry {  
    AEntry(  
        std::string m_bas_accounts_text;  
        std::string m_field_heading_text;  
        std::optional<std::string> m_field_description;  
    );  
};
```
